Roameo plans your trip and lets you decide on the money

AI agents do the legwork. Code checks the money. You make the call.

An agent here is an AI helper with one job.

PEAAII AI Applications Hackathon 2026, Agentic AI

Try it | Code

Alex has $600
Chicago, 4 days. A student we made up.

Roameo asks first
Where from, and when? From Boston, Nov 20.

AI agents search
8 flights, 18 hotels, 59 events. Cold, rain likely.

Code adds it up
The first plan costs $1,235.

Five fixes
One at a time, ending at $780.

$180 over
Still over Alex's $600 budget.

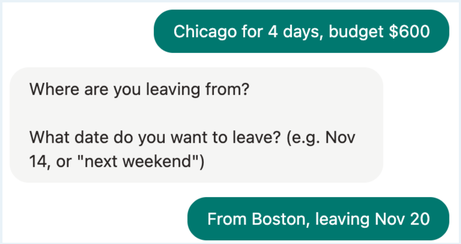

It stops and asks
Raise the budget, 2 nights, or drive?

Alex says OK
Budget raised, it fits. From our tests.

Roameo treats your budget as a limit, not a wish.

AI agents do the legwork

They ask for what is missing

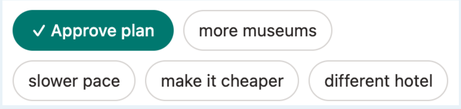

Alex did not say where from or when, so Roameo asks. It never guesses a city or a date, because a guess gives a useless plan. It assumes one traveler and says so.

They choose the searches

8 flights **18** hotels **59** events compared for Alex

Past years' weather for those dates said cold, with a 67% chance of rain. So Roameo also looked for indoor places, holiday markets and ice skating.

They turn your words into changes

Say make it cheaper or more museums. Roameo edits the plan instead of starting over, and lists what changed.

How we tested it

A test is a conversation we wrote in advance, typed into Roameo, with code that checks the answer. Tests check that it asks when a date, a city or the starting point is missing. Only the AI understood first weekend of December.

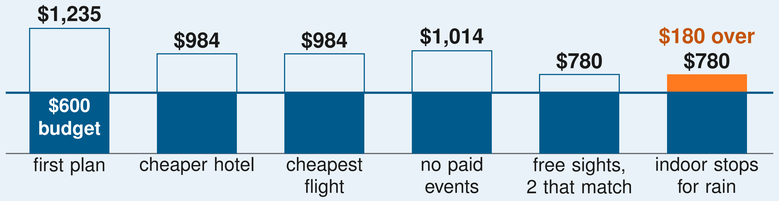

Code checks the money

Code adds up every total

flights: **$278** | hotel: **$162** | activities: **$0** | food estimate: **$280** | local transit estimate: **$60**

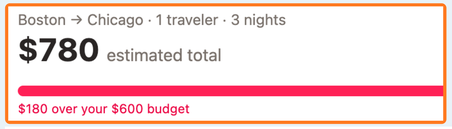

The flight and hotel are live prices. Food and local transit are flat daily estimates, and say so. Code adds them to $780, exact for the prices shown.

It tries one fix at a time, at most five

Not every fix saves money, so code checks the total after each one.

It shows the gap, never hides it

Why code and not the AI? The total is checked after every change, six times for Alex. Code gives the same exact sum every time, and we can test it.

How we tested it

All 23 core tests pass in demo mode, practice runs with sample prices, and in each of 3 runs with the AI on. With a $300 budget, it reports $478 over.

You make the call

89% of travelers want AI help planning, but only 12% would let it decide alone [2].

You choose how to close the gap

> The cheapest plan I can build is $780, $180 over your $600 budget. Would you like to raise the budget, shorten to 2 nights, or drive instead of flying?

Raise the budget, stay two nights, or drive. From our tests, when the budget is raised, the plan is rebuilt, checked again, and fits.

You see every step and every assumption

- Dates: Fri Nov 20 – Mon Nov 23, 2026.
- Assumed 1 traveler.

Live data: google flights, google hotels, google maps
Sights from our curated list show typical admission prices (est.).

The list of what the agents did shows all 25 steps of Alex's run. The plan says which prices are live and which are estimates.

Nothing is final until you say OK

Saying OK only downloads a calendar file. Roameo never books or pays, because paying is a decision a person should make, on a site they trust. You book it yourself.

How we tested it

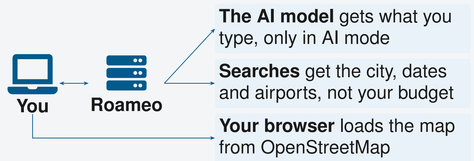

Nothing counts as approved until you say OK. We ran the AI tests 3 times because the AI can answer differently each time. We wrote the tests ourselves, on sample prices, so this is a small, honest check, not a user study.

Who it is for, and who else helps plan trips

Built for students on short trips, budget travelers and small groups who split the cost, first student clubs. A club of four sees 2 rooms and the cost per person before anyone pays. The code is public on GitHub.

Chat assistants such as ChatGPT and Gemini answer in a chat. Expedia's Romie helps plan, shop and book inside Expedia [3]. Planner apps such as Mindtrip, Layla and Wonderplan build itineraries, says a review [4]. Others use spreadsheets, group chats or a travel agency. We have not tested the others.

Responsible use and limits

Never books or pays. No accounts, trips stay in memory until a restart. Sample prices are labeled. AI tips can be wrong. Not yet, 8 demo cities and no user study, so next is a pilot with 5 to 10 students.

Three ideas, one trip

AI agents did the legwork for Alex. Code checked the money and found the $180 gap. Alex made the call.

Thanks to the PEAAII organizers. Data from Google Flights, Hotels, Events and Maps through SerpApi, Ticketmaster, Open-Meteo and OpenStreetMap. AI model Claude Haiku 5.5 through OpenRouter. Poster theme Gemini by Anish Athalye. Sources [2] Booking.com 2025, [3] Expedia 2024, [4] Fast.io 2026. Try it at roameo-l13h.onrender.com, code at github.com/TinyZhen/Travel_Agent.
