Roameo: agents plan the trip, you make the call

An AI trip planner that does the research and the math, and asks before it goes over your budget

Zhen Lu Noctis Zhang PEAAII AI Applications Hackathon 2026, Agentic AI October 2026

Try it Code

Alex has $600 and one sentence

1 Alex asks Alex, a student (an illustration)

Chicago for 4 days, budget $600 $600

2 It asks back, never guesses

Where are you leaving from? What date?

From Boston, leaving Nov 20

3 AI agents research

8 flights 18 hotels 59 events

rain and cold typical for those dates, so indoor stops too

4 The critic, plain code, checks the money

first plan **$1,235** → 5 repairs → cheapest it built **$780** **$180 over the $600 budget**

5 Alex decides

raise the budget shorten to 2 nights drive instead

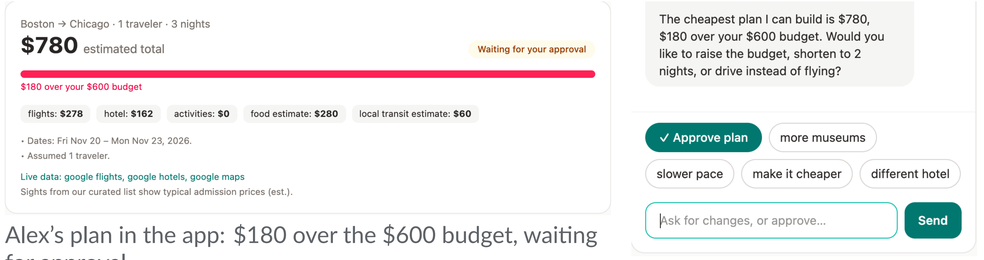

The plan is rebuilt and checked again, then waits.

Approve: a calendar file. Nothing is booked.

Words and numbers: **one real run** of the app, with live flights, hotels and events. Alex is an illustration.

Built for **students and budget travellers** on short trips, and for small groups who split the cost.

Over budget? It stops and asks you

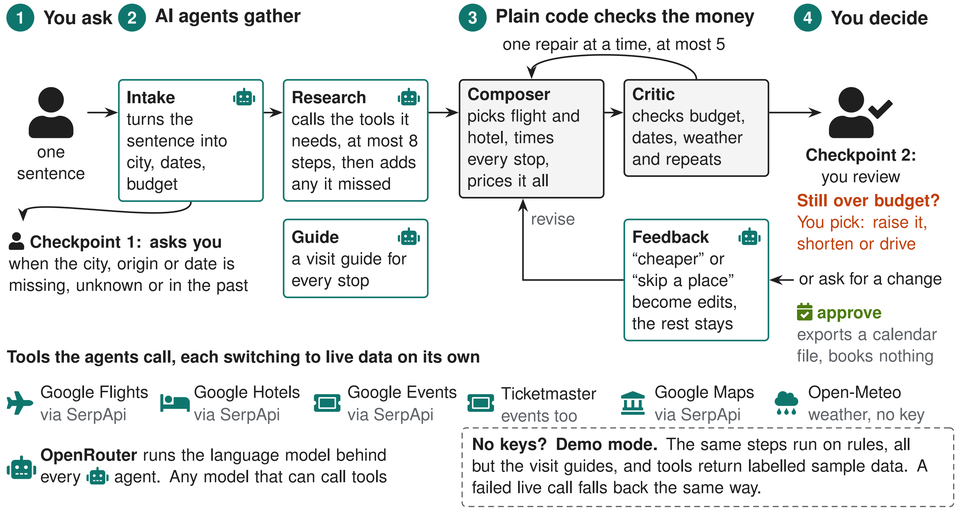

Alex's plan in the app: $180 over the $600 budget, waiting for approval.

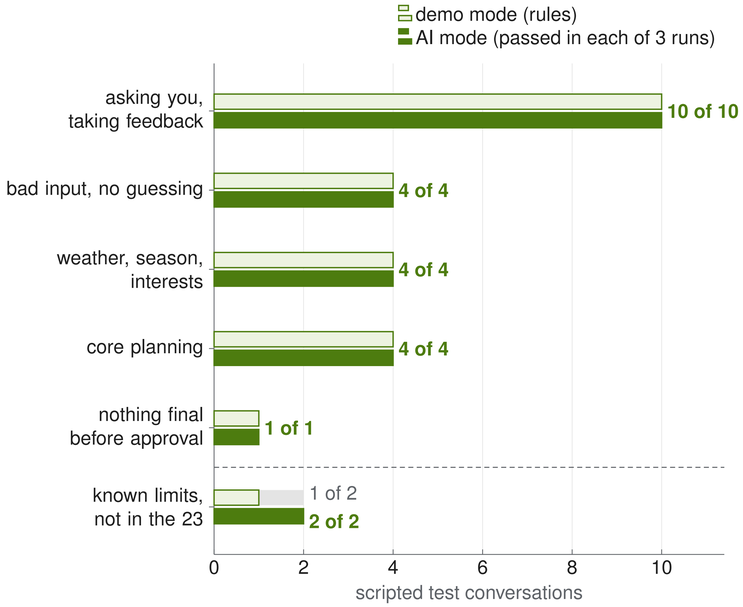

Your call: raise the budget shorten to 2 nights drive instead of flying

AI agents gather, code checks the money, you decide

Why agents, and not one prompt? Each step depends on the one before: the questions, what the tools found, the price after each repair. The agents choose what to look up, and plain code does the arithmetic.

All 23 core tests pass in both modes

A test is a scripted conversation with checks on the result, such as *total within budget*: 51 checks in the 23 core tests. AI mode ran 3 times. We wrote the tests, on sample prices, so this is a small, honest check, not a user study.

Try it, deploy it

No keys: demo mode on a laptop in about 3 minutes.

One Render URL, an access code, 60 requests per visitor per hour. If the live demo asks for an access code, ask us.

Any OpenRouter model. Each tool switches to live data on its own.

Limits: sample data for 7 cities, food and transit are estimates, many events have no price, no user study yet.
